

## Li ion battery charge and care:

Fully charge the battery before using it first time.

Use only the power adapter supplied with the charger.

Plug in the charger before you place the battery in the charger.

Do not install the battery before the charger shows a green light.

Make sure to connect the battery with the correct polarity. Incorrect connection can damage the unit.

The red light on the charger will light up after a short time, indicating charging is taking place. If the red light does not light up, disconnect the battery and re-connect it again. If the red light does not light up after several attempts, the battery does not function.

Green light on the charger indicates fully charged battery. The battery should then be disconnected.

Charge the battery after each use. It does not have to be discharged before charging.

Do not turn on the light, if the light has turned off due to low battery capacity. Turning on the light with a fully discharged battery can damage the battery.

Charge time will depend on the remaining charge in the battery and the surrounding temperature.

Remove the battery from the light if it is not going to be used for extended period of time.

NOTE – Do never leave the battery discharged. Fully discharging the battery will shorten life time and risk damaging the battery.
